1 DP

1.1 LongestIncreasingSubsequence

Computes the length of the longest increasing subsequence and is easy to be adapted.

Input: array *arr* containing a sequence of length *N*

Output: length of the longest increasing subsequence in *arr*

```

1 // This has not been tested yet
2 // (adapted from tested C++ Murcia Code)
3 public static int LISeasy(int[] arr, int N) {
4     int[] m = new int[N];
5     for (int i = N - 1; i >= 0; i--) {
6         m[i] = 1; //init table
7         for (int j = i + 1; j < N; j++) {
8             // if arr[i] increases the length
9             // of subsequence from array[j]
10            if (arr[j] > arr[i])
11                if (m[i] < m[j] + 1)
12                    // store length of new subseq
13                    m[i] = m[j] + 1;
14        }
15    }
16    // find max in array
17    int longest = 0;

```

```

18 for (int i = 0; i < N; i++) {
19     if (m[i] > longest)
20         longest = m[i];
21 }
22 return longest;
23 }

```

MD5: 7561f576d50b1dc6262568c0fc6c42dd | $\mathcal{O}(n^2)$

1.2 LongestIncreasingSubsequence

Computes the longest increasing subsequence using binary search.

Input: array *arr* containing a sequence and empty array *p* of length *arr.length* for storing indices of the LIS (might be useful to have)

Output: array *s* containing the longest increasing subsequence

```

1 public static int[] LISfast(int[] arr, int[] p) {
2     // p[k] stores index of the predecessor of arr[k]
3     // in the LIS ending at arr[k]
4     // m[j] stores index k of smallest value arr[k]
5     // so there is a LIS of length j ending at arr[k]
6     int[] m = new int[arr.length+1];
7     int l = 0;
8     for (int i = 0; i < arr.length; i++) {
9         // bin search for the largest positive j <= l
10        // with arr[m[j]] < arr[i]
11        int lo = 1;
12        int hi = l;
13        while (lo <= hi) {
14            int mid = (int) (((lo + hi) / 2.0) + 0.6);
15            if (arr[m[mid]] <= arr[i])
16                lo = mid+1;
17            else
18                hi = mid-1;
19        }
20        // lo is 1 greater than length of the
21        // longest prefix of arr[i]
22        int newL = lo;
23        p[i] = m[newL-1];
24        m[newL] = i;
25        // if LIS found is longer than the ones
26        // found before, then update l
27        if (newL > l)
28            l = newL;
29    }
30    // reconstruct the LIS
31    int[] s = new int[l];
32    int k = m[l];
33    for (int i = l-1; i >= 0; i--) {
34        s[i] = arr[k];
35        k = p[k];
36    }
37    return s;
38 }

```

MD5: 1d75905f78041d832632cb76af985b8e | $\mathcal{O}(n \log n)$

2 DataStructures

2.1 Fenwick-Tree

Can be used for computing prefix sums.

```

1 //note that 0 can not be used
2 int[] fwktree = new int[m + n + 1];

```

```

3 public static int read(int index, int[] fenwickTree) {
4     int sum = 0;
5     while (index > 0) {
6         sum += fenwickTree[index];
7         index -= (index & -index);
8     }
9     return sum;
10 }
11 public static int[] update(int index, int addValue,
12     int[] fenwickTree) {
13     while (index <= fenwickTree.length - 1) {
14         fenwickTree[index] += addValue;
15         index += (index & -index);
16     }
17     return fenwickTree;
18 }

```

MD5: 410185d657a3a5140bde465090ff6fb5 | $\mathcal{O}(\log n)$

2.2 Range Maximum Query

process processes an array *A* of length *N* in $\mathcal{O}(N \log N)$ such that *query* can compute the maximum value of *A* in interval $[i, j]$. Therefore $M[a, b]$ stores the maximum value of interval $[a, a + 2^b - 1]$.

Input: dynamic table *M*, array to search *A*, length *N* of *A*, start index *i* and end index *j*

Output: filled dynamic table *M* or the maximum value of *A* in interval $[i, j]$

```

1 public static void process(int[][] M, int[] A, int N)
2 {
3     for (int i = 0; i < N; i++)
4         M[i][0] = i;
5     // filling table M
6     // M[i][j] = max(M[i][j-1], M[i+(1<<(j-1))][j-1]),
7     // cause interval of length 2^j can be partitioned
8     // into two intervals of length 2^(j-1)
9     for (int j = 1; 1 << j <= N; j++) {
10        for (int i = 0; i + (1 << j) - 1 < N; i++) {
11            if (A[M[i][j-1]] >= A[M[i+(1 << (j-1))][j-1]])
12                M[i][j] = M[i][j-1];
13            else
14                M[i][j] = M[i + (1 << (j-1))][j-1];
15        }
16    }
17 }
18 public static int query(int[][] M, int[] A, int N,
19     int i, int j) {
20     // k = |_ log_2(j-i+1) _|
21     int k = (int) (Math.log(j - i + 1) / Math.log(2));
22     if (A[M[i][k]] >= A[M[j - (1 << k) + 1][k]])
23         return M[i][k];
24     else
25         return M[j - (1 << k) + 1][k];
26 }

```

MD5: db0999fa40037985ff27dd1a43c53b80 | $\mathcal{O}(N \log N, 1)$

2.3 Union-Find

Union-Find is a data structure that keeps track of a set of elements partitioned into a number of disjoint subsets. *UnionFind* creates

n disjoint sets each containing one element. *union* joins the sets x and y are contained in. *find* returns the representative of the set x is contained in.

Input: number of elements n , element x , element y

Output: the representative of element x or a boolean indicating whether sets got merged.

```

1 class UnionFind {
2     private int[] p = null;
3     private int[] r = null;
4     private int count = 0;
5
6     public int count() {
7         return count;
8     } // number of sets
9
10    public UnionFind(int n) {
11        count = n; // every node is its own set
12        r = new int[n]; // every node is its own tree with
13            height 0
14        p = new int[n];
15        for (int i = 0; i < n; i++)
16            p[i] = -1; // no parent = -1
17    }
18
19    public int find(int x) {
20        int root = x;
21        while (p[root] >= 0) { // find root
22            root = p[root];
23        }
24        while (p[x] >= 0) { // path compression
25            int tmp = p[x];
26            p[x] = root;
27            x = tmp;
28        }
29        return root;
30    }
31
32    // return true, if sets merged and false, if already
33    // from same set
34    public boolean union(int x, int y) {
35        int px = find(x);
36        int py = find(y);
37        if (px == py)
38            return false; // same set -> reject edge
39        if (r[px] < r[py]) { // swap so that always h[px]
40            //>=h[py]
41            int tmp = px;
42            px = py;
43            py = tmp;
44        }
45        p[py] = px; // hang flatter tree as child of
46        // higher tree
47        r[px] = Math.max(r[px], r[py] + 1); // update (
48        // worst-case) height
49        count--;
50        return true;
51    }
52 }

```

MD5: 5c507168e1ffd9ead25babf7b3769cfd | $\mathcal{O}(\alpha(n))$

2.4 Suffix array

```

#include<algorithm>
using namespace std;

vector<int> sa, pos, tmp, lcp;
string s;
int N, gap;

bool sufCmp(int i, int j) {
    if(pos[i] != pos[j])
        return pos[i] < pos[j];
    i += gap;
    j += gap;
    return (i < N && j < N) ? pos[i] < pos[j] : i > j;
}

void buildSA()
{
    N = s.size();
    for(int i = 0; i < N; ++i) {

```

MD5: 96e0269748dc2834567a075768eb871a | $\mathcal{O}(?)$

3 Graph

3.1 2SAT

```

1 //We assume that ind(not a) = ind(a) + N, with N being
  the number of variables
2 //could however be changed easily
3 public static boolean 2SAT(Vertex[] G) {
4     //call SCC
5     double DFS(G);
6     //check for contradiction
7     boolean poss = true;
8     for(int i = 0; i < S+A; i++) {
9         if(G[i].comp == G[i + (S+A)].comp) {
10             poss = false;
11         }
12     }
13     return poss;
14 }

```

MD5: 6c06a2b59fd3a7df3c31b06c58fdaaf5 | $\mathcal{O}(V + E)$

3.2 Breadth First Search

Iterative BFS. Uses ref Vertex class, no Edge class needed. In this version we look for a shortest path from s to t though we could also find the BFS-tree by leaving out t. *Input:* IDs of start and goal vertex and graph as AdjList *Output:* true if there is a connection between s and g, false otherwise

```

1 public static boolean BFS(Vertex[] G, int s, int t) {
2     //make sure that Vertices vis values are false etc
3     Queue<Vertex> q = new LinkedList<Vertex>();
4     G[s].vis = true;
5     G[s].dist = 0;
6     G[s].pre = -1;
7     q.add(G[s]);
8     //expand frontier between undiscovered and
      discovered vertices
9     while(!q.isEmpty()) {
10         Vertex u = q.poll();
11         //when reaching the goal, return true
12         //if we want to construct a BFS-tree delete this
          line
13         if(u.id == t) return true;
14         //else add adj vertices if not visited
15         for(Vertex v : u.adj) {
16             if(!v.vis) {
17                 v.vis = true;
18                 v.dist = u.dist + 1;
19                 v.pre = u.id;
20                 q.add(v);
21             }

```

```

22     }
23 }
24 //did not find target
25 return false;
26 }

```

MD5: 71f3fa48b4f1b2abdf3557a27a9a136 | $\mathcal{O}(|V| + |E|)$

3.3 BellmanFord

Finds shortest pathes from a single source. Negative edge weights are allowed. Can be used for finding negative cycles.

```

1 public static boolean bellmanFord(Vertex[] G) {
2     //source is 0
3     G[0].dist = 0;
4     //calc distances
5     //the path has max length |V|-1
6     for(int i = 0; i < G.length-1; i++) {
7         //each iteration relax all edges
8         for(int j = 0; j < G.length; j++) {
9             for(Edge e : G[j].adj) {
10                 if(G[j].dist != Integer.MAX_VALUE
11                     && e.t.dist > G[j].dist + e.w) {
12                     e.t.dist = G[j].dist + e.w;
13                 }
14             }
15         }
16     }
17     //check for negative-length cycle
18     for(int i = 0; i < G.length; i++) {
19         for(Edge e : G[i].adj) {
20             if(G[i].dist != Integer.MAX_VALUE
21                 && e.t.dist > G[i].dist + e.w) {
22                 return true;
23             }
24         }
25     }
26     return false;
27 }

```

MD5: d101e6b6915f012b3f0c02dc79e1fc6f | $\mathcal{O}(|V| \cdot |E|)$

3.4 Bipartite Graph Check

Checks a graph represented as adjList for being bipartite. Needs a little adaption, if the graph is not connected.

Input: graph as adjList, amount of nodes N as int

Output: true if graph is bipartite, false otherwise

```

1 public static boolean bipartiteGraphCheck(Vertex[] G){
2     // use bfs for coloring each node
3     G[0].color = 1;
4     Queue<Vertex> q = new LinkedList<Vertex>();
5     q.add(G[0]);
6     while(!q.isEmpty()) {
7         Vertex u = q.poll();
8         for(Vertex v : u.adj) {
9             // if node i not yet visited,
10             // give opposite color of parent node u
11             if(v.color == -1) {
12                 v.color = 1-u.color;
13                 q.add(v);
14             }
15             // if node i has same color as parent node u
16             // the graph is not bipartite

```

```

16     } else if(u.color == v.color)
17         return false;
18     // if node i has different color
19     // than parent node u keep going
20 }
21 }
22 return true;
23 }

```

MD5: e93d242522e5b4085494c86f0d218dd4 | $\mathcal{O}(|V| + |E|)$

3.5 Maximum Bipartite Matching

Finds the maximum bipartite matching in an unweighted graph using DFS.

Input: An unweighted adjacency matrix `boolean[M][N]` with `M` nodes being matched to `N` nodes.

Output: The maximum matching. (For getting the actual matching, little changes have to be made.)

```

1 // A DFS based recursive function that returns true
2 // if a matching for vertex u is possible
3 boolean bpm(boolean bpGraph[][], int u,
4             boolean seen[], int matchR[]) {
5     // Try every job one by one
6     for (int v = 0; v < N; v++) {
7         // If applicant u is interested in job v and v
8         // is not visited
9         if (bpGraph[u][v] && !seen[v]) {
10             seen[v] = true; // Mark v as visited
11
12             // If job v is not assigned to an applicant OR
13             // previously assigned applicant for job v
14             // (which is matchR[v]) has an alternate job
15             // available. Since v is marked as visited in
16             // the above line, matchR[v] in the following
17             // recursive call will not get job v again
18             if (matchR[v] < 0 ||
19                 bpm(bpGraph, matchR[v], seen, matchR)) {
20                 matchR[v] = u;
21                 return true;
22             }
23         }
24     }
25     return false;
26 }
27
28 // Returns maximum number of matching from M to N
29 int maxBPM(boolean bpGraph[][]) {
30     // An array to keep track of the applicants assigned
31     // to jobs. The value of matchR[i] is the applicant
32     // number assigned to job i, the value -1 indicates
33     // nobody is assigned.
34     int matchR[] = new int[N];
35     // Initially all jobs are available
36     for (int i = 0; i < N; ++i)
37         matchR[i] = -1;
38     // Count of jobs assigned to applicants
39     int result = 0;
40     for (int u = 0; u < M; u++) {
41         // Mark all jobs as not seen for next applicant.
42         boolean seen[] = new boolean[N];
43         for (int i = 0; i < N; ++i)
44             seen[i] = false;
45         // Find if the applicant u can get a job
46         if (bpm(bpGraph, u, seen, matchR))

```

```

47         result++;
48     }
49     return result;
50 }

```

MD5: a4cc90bf91c41309ad7aaa0c2514ff06 | $\mathcal{O}(M \cdot N)$

3.6 Bitonic TSP

Input: Distance matrix `d` with vertices sorted in x-axis direction.

Output: Shortest bitonic tour length

```

1 public static double bitonic(double[][] d) {
2     int N = d.length;
3     double[][] B = new double[N][N];
4     for (int j = 0; j < N; j++) {
5         for (int i = 0; i <= j; i++) {
6             if (i < j - 1)
7                 B[i][j] = B[i][j - 1] + d[j - 1][j];
8             else {
9                 double min = 0;
10                for (int k = 0; k < j; k++) {
11                    double r = B[k][i] + d[k][j];
12                    if (min > r || k == 0)
13                        min = r;
14                }
15                B[i][j] = min;
16            }
17        }
18    }
19    return B[N-1][N-1];
20 }

```

3.7 Single-source shortest paths in dag

Not tested but should be working fine Similar approach can be used for longest paths. Simply go through ts and add 1 to the largest longest path value of the incoming neighbors

```

1 public static void dagSSP(Vertex[] G, int s) {
2     //calls topological sort method
3     LinkedList<Integer> sorting = TS(G);
4     G[s].dist = 0;
5     //go through vertices in ts order
6     for (int u : sorting) {
7         for (Edge e : G[u].adj) {
8             Vertex v = e.t;
9             if (v.dist > u.dist + e.w) {
10                 v.dist = u.dist + e.w;
11                 v.pre = u.id;
12             }
13         }
14     }
15 }

```

MD5: 552172db2968f746c4ac0bd322c665f9 | $\mathcal{O}(|V| + |E|)$

3.8 Dijkstra

Finds the shortest paths from one vertex to every other vertex in the graph (SSSP).

For negative weights, add $|\min| + 1$ to each edge, later subtract from result.

To get a different shortest path when edges are ints, add an $\varepsilon = \frac{1}{k+1}$ on each edge of the shortest path of length k , run again.

Input: A source vertex s and an adjacency list G .

Output: Modified adj. list with distances from s and predecessor vertices set.

```

1 public static void dijkstra(Vertex[] G, int s) {
2     G[s].dist = 0;
3     Tuple st = new Tuple(s, 0);
4     PriorityQueue q = new PriorityQueue();
5     q.add(st);
6
7     while(!q.isEmpty()) {
8         Tuple sm = q.poll();
9         Vertex u = G[sm.id];
10        //this checks if the Tuple is still useful, both
11        //checks should be equivalent
12        if(u.vis || sm.dist > u.dist) continue;
13        u.vis = true;
14        for(Edge e : u.adj) {
15            Vertex v = e.t;
16            if(!v.vis && v.dist > u.dist + e.w) {
17                v.pre = u.id;
18                v.dist = u.dist + e.w;
19                Tuple nt = new Tuple(v.id, v.dist);
20                q.add(nt);
21            }
22        }
23    }
24 }
```

MD5: e46eb1b919179dab6a42800376f04d7a | $\mathcal{O}(|E| \log |V|)$

3.9 EdmondsKarp

Finds the greatest flow in a graph. Capacities must be positive.

```

1 public static boolean BFS(Vertex[] G, int s, int t) {
2     int N = G.length;
3     for(int i = 0; i < N; i++) {
4         G[i].vis = false;
5     }
6
7     Queue<Vertex> q = new LinkedList<Vertex>();
8     G[s].vis = true;
9     G[s].pre = -1;
10    q.add(G[s]);
11
12    while(!q.isEmpty()) {
13        Vertex u = q.poll();
14        if(u.id == t) return true;
15        for(int i : u.adj.keySet()) {
16            Edge e = u.adj.get(i);
17            Vertex v = e.t;
18            if(!v.vis && e.rw > 0) {
19                v.vis = true;
20                v.pre = u.id;
21                q.add(v);
22            }
23        }
24    }
25    return (G[t].vis);
26 }
27 //We store the edges in the graph in a hashmap
28 public static int edKarp(Vertex[] G, int s, int t) {
29     int maxflow = 0;
30     while(BFS(G, s, t)) {
```

```

    int pflow = Integer.MAX_VALUE;
    for(int v = t; v != s; v = G[v].pre) {
        int u = G[v].pre;
        pflow = Math.min(pflow, G[u].adj.get(v).rw);
    }
    for(int v = t; v != s; v = G[v].pre) {
        int u = G[v].pre;
        G[u].adj.get(v).rw -= pflow;
        G[v].adj.get(u).rw += pflow;
    }
    maxflow += pflow;
    }
    return maxflow;
}
```

MD5: 6067fa877ff237d82294e7511c79d4bc | $\mathcal{O}(|V|^2 \cdot |E|)$

3.10 Reference for Edge classes

Used for example in Dijkstra algorithm, implements edges with weight. Needs testing.

```

1 //for Kruskal we need to sort edges, use: java.lang.
2 //Comparable
3 class Edge implements Comparable<Edge> {}
4
5 class Edge {
6     //for Kruskal it is helpful to store the start as
7     //well, moreover we might not need the vertex class
8     int s;
9     int t;
10
11    //for EdKarp we also want to store residual weights
12    int rw;
13
14    Vertex t;
15    int w;
16
17    public Edge(Vertex t, int w) {
18        this.t = t;
19        this.w = w;
20        this.rw = w;
21    }
22
23    public Edge(int s, int t, int w) {...}
24
25    public int compareTo(Edge other) {
26        return Integer.compare(this.w, other.w);
27    }
28 }
```

MD5: aae80ac4bfbfcc0b9ac4c65085f6f123 | $\mathcal{O}(1)$

3.11 FloydWarshall

Finds all shortest paths. Paths in array next, distances in ans.

```

1 public static void floydWarshall(int[][] graph,
2                                 int[][] next, int[][] ans) {
3     for(int i = 0; i < ans.length; i++)
4         for(int j = 0; j < ans.length; j++)
5             ans[i][j] = graph[i][j];
6
7     for (int k = 0; k < ans.length; k++)
8         for (int i = 0; i < ans.length; i++)
9             for (int j = 0; j < ans.length; j++)
```

```

10     if (ans[i][k] + ans[k][j] < ans[i][j]
11         && ans[i][k] < Integer.MAX_VALUE
12         && ans[k][j] < Integer.MAX_VALUE) {
13         ans[i][j] = ans[i][k] + ans[k][j];
14         next[i][j] = next[i][k];

3.18 Recursive Depth First Search

Recursive DFS with different options (storing times, connected/unconnected graph). Needs testing.

Input: A source vertex s , a target vertex t , and adjlist G and the time (0 at the start)

Output: Indicates if there is connection between s and t .

```

1 //if we want to visit the whole graph, even if it is
2 //not connected we might use this
3 public static void DFS(Vertex[] G) {
4     //make sure all vertices vis value is false etc
5     int time = 0;
6     for(int i = 0; i < G.length; i++) {
7         if(!G[i].vis) {
8             //note that we leave out t so this does not work
9             //with the below function
10            //adaption will not be too difficult though
11            //time should not always start at zero, change
12            //if needed
13            recDFS(i, G, 0);
14        }
15    }
16 }
17
18 //first call with time = 0

```

```

16 public static boolean recDFS(int s, int t, Vertex[] G,
17     int time){
18     //it might be necessary to store the time of
19     //discovery
20     time = time + 1;
21     G[s].dtime = time;
22
23     G[s].vis = true; //new vertex has been discovered
24     //when reaching the target return true
25     //not necessary when calculating the DFS-tree
26     if(s == t) return true;
27     for(Vertex v : G[s].adj) {
28         //exploring a new edge
29         if(!v.vis) {
30             v.pre = u.id;
31             if(recDFS(v.id, t, G)) return true;
32         }
33     }
34     //storing finishing time
35     time = time + 1;
36     G[s].ftime = time;
37     return false;
38 }

3.22 Topological Sort

```

1 public static LinkedList<Integer> TS(Vertex[] G) {
2     LinkedList<Integer> sorting = new LinkedList<Integer>
3         >();
4     for(int i = 0; i < G.length; i++)
5         if(!G[i].vis)
6             recTS(G[i], sorting);
7     //check sorting for a -1 if the graph is not
8     //necessarily dag
9     //maybe checking if there are too many values in
10    //sorting is easier?!
11    return sorting;
12 }
13
14 public static LinkedList<Integer> recTS(Vertex u,
15     LinkedList<Integer> sorting) {
16     u.vis = true;
17     for(Vertex v : u.adj)
18         if(v.vis)
19             recTS(v, sorting);
20     sorting.add(u.id);
21 }

```

```

1 //the -1 indicates that it will not be possible
2 //to find an TS
3 //there might be a much faster and elegant way (
4 //flag?!)
5 sorting.addFirst(-1);
6 else
7     recTS(v, sorting);
8 sorting.addFirst(u.id);
9 return sorting;
10 }

```

MD5: f6459575bf0d53344ddd9e5daf1dfbb8 | $\mathcal{O}(|V| + |E|)$

3.23 Tuple

Simple tuple class used for priority queue in Dijkstra and Prim

```

1 class Tuple implements Comparable<Tuple> {
2
3     int id;
4     int dist;
5
6     public Tuple(int id, int dist) {
7         this.id = id;
8         this.dist = dist;
9     }
10
11     public int compareTo(Tuple other) {
12         return Integer.compare(this.dist, other.dist);
13     }
14 }

```

MD5: fb1aa32dc32b9a2bac6f44a84e7f82c7 | $\mathcal{O}(1)$

3.24 Reference for Vertex classes

Used in many graph algorithms, implements a vertex with its edges. Needs testing.

```

1 class Vertex {
2
3     int id;
4     boolean vis = false;
5     int pre = -1;
6
7     //for dijkstra and prim
8     int dist = Integer.MAX_VALUE;
9
10    //for SCC store number indicating the dedicated
11    //component
12    int comp = -1;
13
14    //for DFS we could store the start and finishing
15    //times
16    int dtime = -1;
17    int ftime = -1;
18
19    //use an ArrayList of Edges if those information are
20    //needed
21    ArrayList<Edge> adj = new ArrayList<Edge>();
22    //use an ArrayList of Vertices else
23    ArrayList<Vertex> adj = new ArrayList<Vertex>();
24    //use two ArrayLists for SCC
25    ArrayList<Vertex> in = new ArrayList<Vertex>();
26    ArrayList<Vertex> out = new ArrayList<Vertex>();
27 }

```

```

25 //for EdmondsKarp we need a HashMap to store Edges,
    Integer is target
26 HashMap<Integer, Edge> adj = new HashMap<Integer,
    Edge>();
27
28 //for bipartite graph check
29 int color = -1;
30
31 //we store as key the target
32 public Vertex(int id) {
33     this.id = id;
34 }
35 }

```

MD5: 90e8120ce9f665b07d4388e30395dd36 | $\mathcal{O}(1)$

4 Math

4.1 Binomial Coefficient

Gives binomial coefficient (n choose k)

```

1 public static long bin(int n, int k) {
2     if (k == 0)
3         return 1;
4     else if (k > n/2)
5         return bin(n, n-k);
6     else
7         return n*bin(n-1, k-1)/k;
8 }

```

MD5: 32414ba5a444038b9184103d28fa1756 | $\mathcal{O}(k)$

4.2 Binomial Matrix

Gives binomial coefficients for all $K \leq N$.

```

1 public static long[][] binomial_matrix(int N, int K) {
2     long[][] B = new long[N+1][K+1];
3     for (int k = 1; k <= K; k++)
4         B[0][k] = 0;
5     for (int m = 0; m <= N; m++)
6         B[m][0] = 1;
7     for (int m = 1; m <= N; m++)
8         for (int k = 1; k <= K; k++)
9             B[m][k] = B[m-1][k-1] + B[m-1][k];
10    return B;
11 }

```

MD5: e6f103bd9852173c02a1ec64264f4448 | $\mathcal{O}(N \cdot K)$

4.3 Divisability

Calculates (alternating) k-digitSum for integer number given by M.

```

1 public static long digit_sum(String M, int k, boolean
    alt) {
2     long dig_sum = 0;
3     int vz = 1;
4     while (M.length() > k) {
5         if (alt) vz *= -1;
6         dig_sum += vz*Integer.parseInt(M.substring(M.
            length()-k));

```

```

7         M = M.substring(0, M.length()-k);
8     }
9     if (alt)
10        vz *= -1;
11    dig_sum += vz*Integer.parseInt(M);
12    return dig_sum;
13 }
14
15 // example: divisibility of M by 13
16 public static boolean divisible13(String M) {
17     return digit_sum(M, 3, true)%13 == 0;
18 }

```

MD5: 33b3094ebf431e1e71cd8e8db3c9cdd6 | $\mathcal{O}(|M|)$

4.4 Graham Scan

Multiple unresolved issues: multiple points as well as collinearity.
 N denotes the number of points

```

1 public static Point[] grahamScan(Point[] points) {
2     //find leftmost point with lowest y-coordinate
3     int xmin = Integer.MAX_VALUE;
4     int ymin = Integer.MAX_VALUE;
5     int index = -1;
6     for(int i = 0; i < points.length; i++) {
7         if(points[i].y < ymin || (points[i].y == ymin &&
            points[i].x < xmin)) {
8             xmin = points[i].x;
9             ymin = points[i].y;
10            index = i;
11        }
12    }
13    //get that point to the start of the array
14    Point tmp = new Point(points[index].x, points[index
        ].y);
15    points[index] = points[0];
16    points[0] = tmp;
17    for(int i = 1; i < points.length; i++)
18        points[i].src = points[0];
19    Arrays.sort(points, 1, points.length);
20    //for collinear points eliminate all but the
    farthest
21    boolean[] isElem = new boolean[points.length];
22    for(int i = 1; i < points.length-1; i++) {
23        Point a = new Point(points[i].x - points[i].src.x,

5.2 Next number with n bits set

From x the smallest number greater than x with the same amount of bits set is computed. Little changes have to be made, if the calculated number has to have length less than 32 bits.

Input: number x with n bits set ($x = (1 \ll n) - 1$)

Output: the smallest number greater than x with n bits set

```

1 public static int nextNumber(int x) {
2     //break when larger than limit here
3     if(x == 0) return 0;
4     int smallest = x & -x;
5     int ripple = x + smallest;
6     int new_smallest = ripple & -ripple;
7     int ones = ((new_smallest/smallest) >> 1) - 1;
8     return ripple | ones;
9 }

```

MD5: 2d8a79cb551648e67fc3f2f611a4f63c | $\mathcal{O}(1)$

5.3 Next Permutation

Returns true if there is another permutation. Can also be used to compute the nextPermutation of an array.

Input: String a as char array

Output: true, if there is a next permutation of a , false otherwise

```

1 public static boolean nextPermutation(char[] a) {
2     int i = a.length - 1;
3     while(i > 0 && a[i-1] >= a[i])
4         i--;
5     if(i <= 0)
6         return false;
7     int j = a.length - 1;
8     while (a[j] <= a[i-1])
9         j--;
10    char tmp = a[i - 1];
11    a[i - 1] = a[j];
12    a[j] = tmp;
13
14    j = a.length - 1;
15    while(i < j) {
16        tmp = a[i];
17        a[i] = a[j];
18        a[j] = tmp;
19        i++;
20        j--;
21    }
22    return true;
23 }

```

MD5: 7d1fe65d3e77616dd2986ce6f2af089b | $\mathcal{O}(n)$

6 String

6.1 Knuth-Morris-Pratt

Input: String s to be searched, String w to search for.

Output: Array with all starting positions of matches

```

1 public static ArrayList<Integer> kmp(String s, String
2     w) {
3     ArrayList<Integer> ret = new ArrayList<>();
4     //Build prefix table
5     int[] N = new int[w.length()+1];
6     int i=0; int j = -1; N[0]=-1;
7     while (i<w.length()) {
8         while (j>=0 && w.charAt(j) != w.charAt(i))
9             j = N[j];
10        i++; j++; N[i]=j;
11    }
12    //Search string
13    i=0; j=0;
14    while (i<s.length()) {
15        while (j>=0 && s.charAt(i) != w.charAt(j))
16            j = N[j];
17        i++; j++;
18        if (j==w.length()) { //match found
19            ret.add(i-w.length()); //add its start index
20            j = N[j];
21        }
22    }
23    return ret;
24 }

```

MD5: 3cb03964744db3b14b9bff265751c84b | $\mathcal{O}(n + m)$

6.2 Levenshtein Distance

Calculates the Levenshtein distance for two strings (minimum number of insertions, deletions, or substitutions).

Input: A string a and a string b .

Output: An integer holding the distance.

```

1 public static int levenshteinDistance(String a, String
2     b) {
3     a = a.toLowerCase();
4     b = b.toLowerCase();
5     int[] costs = new int[b.length() + 1];
6
7     for (int j = 0; j < costs.length; j++)
8         costs[j] = j;
9
10    for (int i = 1; i <= a.length(); i++) {
11        costs[0] = i;
12        int nw = i - 1;
13        for (int j = 1; j <= b.length(); j++) {
14            int cj = Math.min(1 + Math.min(costs[j], costs[j
15                - 1]),
16                a.charAt(i - 1) == b.charAt(j - 1) ? nw : nw +
17                1);
18            nw = costs[j];
19            costs[j] = cj;
20        }
21    }
22    return costs[b.length()];
23 }

```

MD5: 79186003b792bc7fd5c1ffbbcf2b1c6 | $\mathcal{O}(|a| \cdot |b|)$

6.3 Longest Common Subsequence

Finds the longest common subsequence of two strings.

Input: Two strings *string1* and *string2*.

Output: The LCS as a string.

```

1 public static String longestCommonSubsequence(String
2   string1, String string2) {
3   char[] s1 = string1.toCharArray();
4   char[] s2 = string2.toCharArray();
5   int[][] num = new int[s1.length + 1][s2.length + 1];
6   // Actual algorithm
7   for (int i = 1; i <= s1.length; i++)
8     for (int j = 1; j <= s2.length; j++)
9       if (s1[i - 1] == s2[j - 1])
10        num[i][j] = 1 + num[i - 1][j - 1];
11      else
12        num[i][j] = Math.max(num[i - 1][j], num[i][j - 1]);
13  // System.out.println("length of LCS = " + num[s1.
14    length][s2.length]);
15  int s1position = s1.length, s2position = s2.length;
16  List<Character> result = new LinkedList<Character>()

31  int i = 0;
32  for (Character c : result) {
33    resultString[i] = c;
34    i++;
35  }
36  return new String(resultString);
37 }

```

MD5: 4dc4ee3af14306bea5724ba8a859d5d4 | $\mathcal{O}(n \cdot m)$

6.4 Longest common substring

gets two String and finds all LCSs and returns them in a set

```

1 public static TreeSet<String> LCS(String a, String b)
2 {
3   int[][] t = new int[a.length()+1][b.length()+1];
4   for(int i = 0; i <= b.length(); i++)
5     t[0][i] = 0;
6
7   for(int i = 0; i <= a.length(); i++)
8     t[i][0] = 0;
9
10  for(int i = 1; i <= a.length(); i++)
11    for(int j = 1; j <= b.length(); j++)
12      if(a.charAt(i-1) == b.charAt(j-1))
13        t[i][j] = t[i-1][j-1] + 1;
14      else
15        t[i][j] = 0;
16  int max = -1;

```

```

16  for(int i = 0; i <= a.length(); i++)
17    for(int j = 0; j <= b.length(); j++)
18      if(max < t[i][j])
19        max = t[i][j];
20  if(max == 0 || max == -1)
21    return new TreeSet<String>();
22  TreeSet<String> res = new TreeSet<String>();
23  for(int i = 0; i <= a.length(); i++)
24    for(int j = 0; j <= b.length(); j++)
25      if(max == t[i][j])
26        res.add(a.substring(i-max, i));
27  return res;
28 }

```

MD5: 9de393461e1faebe99af3ff8db380bde | $\mathcal{O}(|a| * |b|)$

7 Math Roland

7.1 Divisability Explanation

$D \mid M \Leftrightarrow D \mid \text{digit_sum}(M, k, \text{alt})$, refer to table for values of D, k, alt .

7.2 Combinatorics

- Variations (ordered): k out of n objects (permutations for $k = n$)

- without repetition:

$$M = \{(x_1, \dots, x_k) : 1 \leq x_i \leq n, x_i \neq x_j \text{ if } i \neq j\}, \\ |M| = \frac{n!}{(n-k)!}$$

- with repetition:

$$M = \{(x_1, \dots, x_k) : 1 \leq x_i \leq n\}, |M| = n^k$$

- Combinations (unordered): k out of n objects

- without repetition: $M = \{(x_1, \dots, x_n) : x_i \in \{0, 1\}, x_1 + \dots + x_n = k\}, |M| = \binom{n}{k}$

- with repetition: $M = \{(x_1, \dots, x_n) : x_i \in \{0, 1, \dots, k\}, x_1 + \dots + x_n = k\}, |M| = \binom{n+k-1}{k}$

- Ordered partition of numbers: $x_1 + \dots + x_k = n$ (i.e. $1+3+3+1=4$ are counted as 2 solutions)

- #Solutions for $x_i \in \mathbb{N}_0$: $\binom{n+k-1}{k-1}$

- #Solutions for $x_i \in \mathbb{N}$: $\binom{n-1}{k-1}$

- Unordered partition of numbers: $x_1 + \dots + x_k = n$ (i.e. $1+3+3+1=4$ are counted as 1 solution)

- #Solutions for $x_i \in \mathbb{N}$: $P_{n,k} = P_{n-k,k} + P_{n-1,k-1}$ where $P_{n,1} = P_{n,n} = 1$

- Derangements (permutations without fixed points): $!n = n! \sum_{k=0}^n \frac{(-1)^k}{k!} = \lfloor \frac{n!}{e} + \frac{1}{2} \rfloor$

7.3 Polynomial Interpolation

7.3.1 Theory

Problem: for $\{(x_0, y_0), \dots, (x_n, y_n)\}$ find $p \in \Pi_n$ with $p(x_i) = y_i$ for all $i = 0, \dots, n$.

Solution: $p(x) = \sum_{i=0}^n \gamma_{0,i} \prod_{j=0}^{i-1} (x - x_j)$ where $\gamma_{j,k} = y_j$ for $k = 0$

and $\gamma_{j,k} = \frac{\gamma_{j+1,k-1} - \gamma_{j,k-1}}{x_{j+k} - x_j}$ otherwise.

Efficient evaluation of $p(x)$: $b_n = \gamma_{0,n}$, $b_i = b_{i+1}(x - x_i) + \gamma_{0,i}$ for $i = n-1, \dots, 0$ with $b_0 = p(x)$.

7.4 Fibonacci Sequence

7.4.1 Binet's formula

$$\begin{pmatrix} f_n \\ f_{n+1} \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix}^n \begin{pmatrix} 0 \\ 1 \end{pmatrix} \Rightarrow f_n = \frac{1}{\sqrt{5}}(\phi^n - \tilde{\phi}^n) \text{ where } \phi = \frac{1+\sqrt{5}}{2} \text{ and } \tilde{\phi} = \frac{1-\sqrt{5}}{2}.$$

7.4.2 Generalization

$$g_n = \frac{1}{\sqrt{5}}(g_0(\phi^{n-1} - \tilde{\phi}^{n-1}) + g_1(\phi^n - \tilde{\phi}^n)) = g_0 f_{n-1} + g_1 f_n$$

for all $g_0, g_1 \in \mathbb{N}_0$

7.4.3 Pisano Period

Both $(f_n \bmod k)_{n \in \mathbb{N}_0}$ and $(g_n \bmod k)_{n \in \mathbb{N}_0}$ are periodic.

7.5 Reihen

$$\sum_{i=1}^n i = \frac{n(n+1)}{2}, \sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6}, \sum_{i=1}^n i^3 = \frac{n^2(n+1)^2}{4}$$

$$\sum_{i=0}^n c^i = \frac{c^{n+1}-1}{c-1}, c \neq 1, \sum_{i=0}^{\infty} c^i = \frac{1}{1-c}, \sum_{i=1}^n c^i = \frac{c}{1-c}, |c| < 1$$

$$\sum_{i=0}^n i c^i = \frac{nc^{n+2} - (n+1)c^{n+1} + c}{(c-1)^2}, c \neq 1, \sum_{i=0}^{\infty} i c^i = \frac{c}{(1-c)^2}, |c| < 1$$

7.6 Binomialkoeffizienten

7.7 Catalanzahlen

$$C_n = \frac{1}{n+1} \binom{2n}{n} = \frac{(2n)!}{(n+1)!n!}$$

$$C_0 = 1, C_{n+1} = \sum_{k=0}^n C_k C_{n-k}, C_{n+1} = \frac{4n+2}{n+2} C_n$$

7.8 Geometrie

Polygonfläche: $A = \frac{1}{2}(x_1 y_2 - x_2 y_1 + x_2 y_3 - x_3 y_2 + \dots + x_{n-1} y_n - x_n y_{n-1} + x_n y_1 - x_1 y_n)$

7.9 Zahlentheorie

Chinese Remainder Theorem: Es existiert eine Zahl C , sodass:

$$C \equiv a_1 \pmod{n_1}, \dots, C \equiv a_k \pmod{n_k}, \text{ggT}(n_i, n_j) = 1, i \neq j$$

Fall $k = 2$: $m_1 n_1 + m_2 n_2 = 1$ mit EEA finden.

Lösung ist $x = a_1 m_2 n_2 + a_2 m_1 n_1$.

Allgemeiner Fall: iterative Anwendung von $k = 2$

Eulersche φ -Funktion: $\varphi(n) = n \prod_{p|n} (1 - \frac{1}{p})$, p prim

$$\varphi(p) = p - 1, \varphi(pq) = \varphi(p)\varphi(q), p, q \text{ prim}$$

$$\varphi(p^k) = p^k - p^{k-1}, p, q \text{ prim}, k \geq 1$$

Eulers Theorem: $a^{\varphi(n)} \equiv 1 \pmod{n}$

Fermats Theorem: $a^p \equiv a \pmod{p}$, p prim

7.10 Faltung

$$(f * g)(n) = \sum_{m=-\infty}^{\infty} f(m)g(n-m) = \sum_{m=-\infty}^{\infty} f(n-m)g(m)$$

8 Java Knowhow

8.1 System.out.printf() und String.format()

Syntax: %[flags][width][.precision][conv]

flags:

- left-justify (default: right)
- + always output number sign
- 0 zero-pad numbers
- (space) space instead of minus for pos. numbers
- , group triplets of digits with ,

width specifies output width

precision is for floating point precision

conv:

- d byte, short, int, long
- f float, double
- c char (use C for uppercase)
- s String (use S for all uppercase)

8.2 Modulo: Avoiding negative Integers

```
1 int mod = (((nums[j] % D) + D) % D);
```

8.3 Speed up IO

Use

```
1 BufferedReader br = new BufferedReader(new
2 InputStreamReader(System.in));
```

Use

```
Double.parseDouble(Scanner.next());
```
